

Anti-skimming protection through TMD

Card fraud is nothing new, but criminals are taking advantage of new technologies to come up with new fraud techniques. Through TMD Security, we can offer anti-skimming hardware to help combat Card skimming issues, allowing you and your customers to breath easily at the ATM.

Proven track record

TMD Security introduced their Card Protection Kit in 2004, and has a proven track record in anti-skimming technology. Their technology has been refined and perfected since even then, further pushing themselves as the industry standard.

Our partnership with TMD Security allows us to protect your financial equipment from:

- Digital Skimming - magnetic strip copying
- Analogue skimming - recording card data signal
- Stereo skimming - devices that have two read heads

Hardware packages include anti-skimming with tilt and vibration protection, skimming device detection, anti-card trapping and metal detection. We offer security packages that can best fit your needs and security concerns. Contact us today to learn more.

Card Protection Plate

The Card Protection Plate defends against deep insert skimmers and shimmers that are inserted deep inside the ATM or ITM. These devices cannot be detected, and anti-skimming solutions that use jamming technology are not designed to defend against them.

Card Protection Plate's effectiveness is based on a simple principle: it fills the space in the card reader that criminals need for deep insert skimming. It cannot be displaced or removed by unauthorized personnel and most importantly protects cardholder data with no impact on functionality.

The benefits of the Card Protection Plate are:

- Deep insert skimming prevention
- Self defense against attack
- Tamper switch to check the presence of CPP
- Defense against shimmering
- Fast Installation
- No maintenance
- Works with Card Protection Kit & Active Dip Kit
- No impact on transactions

Active Dip Kit

The Active Dip Kit is a revolutionary breakthrough in anti-skimming for DIP card readers. It does not rely on detection of a skimming device. The jamming signal is always on, continuously protecting the data on the magnetic stripe without affecting the performance of the DIP card reader.

- Game-changing anti-skimming technology for DIP
- Continuous active protection
- Optimum security
- Maximum ATM availability
- Available for a range of ATM models
- Real-time protection against physical attacks
- Information on suspected skimming attacks
- Complementary security
- Remote monitoring and fraud management
